DGM Growers - from field to shelf with the aid of **Driver Southall**

When **DGM Growers** of Spalding, Lincolnshire needed equipment to check their pre-packed potatoes, who did they turn to? **Driver Southall**.

Faced with the requirement to check the weight of packed potatoes, and to ensure that none of the packs were contaminated with metal, **Driver Southall** teamed up with metal detector manufacturers Safeline to produce a checkweigher / metal detector combination unit.

The **Driver Southall** P1000 checkweigher dynamically weighs the packs of potatoes coming off a packing machine. Correct weight packs are passed onto the packing table whilst under and over weight packs are rejected into a lockable bin.

The metal detector checks the packs for metal contamination at the same time and any non conforming packs are rejected into a separate lockable bin.

Weighing packs of potatoes from 200g to 5kg is no problem for the P1000 as up to 20 different product settings can be pre-programmed into the unit to speed up changeover times.

Steve Smith of **DGM** said;

“We had heard of **Driver Southall** before and knew they had a good reputation, so they were the first people we called. They certainly came up trumps with this solution. I would have no hesitation in recommending them to any company.”
